

Why are the docs + nurses
worried about Covid19?

80% of Patients are fine!

Because: they infect the other 15-20%

There are 1.1 million people in SK.

Without drastic measures 80% will be
infected = 880 000 people

10% of those will need hospitalization = 132 000

5% will need ICU = 61 000 ICU Beds we
do not have

Even with 30% of the province getting infected
(which is what serious measures might get us) and
let's say only 1% - 2% of those need intubation
that's still thousands of people more
than we have breathing machines.

Without those breathing
machines people will die.

So when we ask... "Are we overreacting" the
answer is "I really hope so."

So is it all bad news?

We are not ^{No.} helpless. This is in our control.
